

IE3121 – Enterprise Architecture Business Architecture Assessment Report

Client Organization: Gen-Z – Men's, Boys' Clothing & Perfume Store

Project: A Modern Digital Storefront for Gen-Z

Field	Details
Group Number	ISE_WE_0201_58
Project Manager	IT24101208 – Warnakula S P
Group Members	IT24101437 – Sashorinth N IT24103841 – Razni Ahamed B S
Lecturer / Instructor	Ms. Chathurangika Kahandawaarachchi
Submission Date	29th August 2026

1. Executive Summary

Gen-Z is a men's, boys' clothing and perfume retail store that currently operates primarily through a physical outlet, relying on in-person visits and informal, ad-hoc communication (phone calls and word-of-mouth) to manage customer enquiries, orders and product information. This dependence on manual, offline processes restrict the store's reach to customers who cannot visit in person, creates inconsistent and error-prone product and order records, and gives the owner limited real-time visibility into sales, stock and customer feedback.

This report presents a business architecture assessment conducted to evaluate the current (As-Is) way Gen-Z operates and to identify the business value of introducing a digital storefront. The assessment covers the organization's profile, the core business problem driving the need for change, an analysis of the stakeholders involved, and a detailed evaluation of the store's four core business capabilities: Product & Catalogue Management, Customer & Order Management, Delivery Tracking with Review Management, and Store Administration Management.

For each capability, the current business process was mapped using a UML activity diagram with swim lanes, validated through peer review, and analysed to surface operational weaknesses such as manual data entry, delayed order confirmation, inconsistent stock visibility, lack of delivery tracking and customer order-status visibility, and the absence of a centralized moderation and administration mechanism.

The assessment finds that Gen-Z's core business need is not additional staff or a larger physical footprint, but a centralized digital platform that consolidates catalogue management, order handling, delivery tracking, customer feedback and administrative oversight — while deliberately keeping Phase 1 scope lean by using WhatsApp-based ordering instead of an online payment gateway. The findings in this report form the baseline (As-Is) evidence that will directly inform the To-Be process design and the information and technology architecture proposals in the subsequent evaluations.

2. Organization Profile

Attribute	Description
Organization name	Gen-Z
Industry sector	Retail – Fashion & Apparel
Size	Small-to-medium independent retail business; single physical storefront operated by an owner with a small support/sales staff
Products / services	Men's clothing, boys' clothing, and perfumes, sold primarily through an in-store, walk-in retail model
Organizational structure	Flat, owner-managed structure: Store Owner/Administrator at the top, supported by sales/floor staff; all key decisions are currently made directly by the owner
Current business environment	Highly competitive local men's fashion retail segment where digitally enabled competitors can reach customers beyond the immediate neighbourhood; customer engagement today happens mainly through in-person visits, phone calls and informal WhatsApp messages
Existing information systems	No formal software system; product, stock and order information is maintained manually or ERP is used; WhatsApp is used informally for customer enquiries but is not integrated into any structured order or inventory process

3. Business Problem Statement

Gen-Z's operations are currently constrained by its dependence on physical store visits and informal communication channels for nearly every core business function. This creates the following operational issues and business challenges:

- Limited market reach: customers who cannot visit the physical store are unable to browse the catalogue or place orders, capping the store's addressable customer base and sales potential.
- Inconsistent product and stock information: Without a centralized catalogue, product details, pricing and stock levels are tracked manually, increasing the risk of errors, outdated listings and lost sales from items shown as available when they are not.
- Unstructured order and delivery handling: Orders placed informally over calls or messages are not consistently recorded, making it difficult to track order status, coordinate delivery handovers, monitor delivery progress, or analyse sales trends.
- No mechanism for customer trust-building: There is currently no structured way for customers to leave reviews or ratings, limiting the store's ability to build online trust or gather feedback for product improvement.
- Lack of centralized administrative oversight: the owner has no single dashboard to monitor products, orders, reviews and overall store activity, forcing reliance on memory and manual cross-checking.

Digital transformation is required because these issues directly limit revenue growth, increase the owner's operational workload, and put Gen-Z at a competitive disadvantage relative to other fashion retailers that already offer an online presence. The scope of this assessment is limited to evaluating Gen-Z's business architecture as the basis for a Phase 1 digital storefront: a web-based platform supporting product browsing, a WhatsApp-based checkout workflow (deliberately excluding an online payment gateway and a native mobile app in this phase), delivery and order-status tracking, customer reviews, and a self-service admin dashboard for the store owner.

4. Stakeholder Analysis

4.1 Stakeholder Identification

Stakeholder	Internal / External	Role
Store Owner / Administrator	Internal	Overall business owner; manages products, orders, reviews and store settings; final decision-maker
Sales / Floor Staff	Internal	Assists with in-store sales and may support order fulfilment and dispatch
Customers	External	Browse products, place orders via WhatsApp checkout, submit reviews and ratings
Suppliers	External	Provide clothing and perfume stock that is listed in the catalogue
Delivery Person	External	Collects packed customer orders from the store, delivers them to customers, and updates delivery status
Module Lecturer / Instructor (Academic Stakeholder)	External	Evaluates the project deliverables and provides guidance/feedback

4.2 Stakeholder Matrix

Stakeholder	Role	Interest	Influence	Impact	Engagement Strategy
Store Owner	Business decision-maker	High	High	High	Manage closely – direct, continuous involvement in requirements and sign-off
Customers	End users / buyers	High	Medium	High	Keep informed – gather feedback via reviews and usability testing
Sales Staff	Order/stock support	Medium	Low	Low	Keep informed – brief on new order/dispatch workflow
Suppliers	Stock providers	Low	Low	Low	Monitor – minimal direct engagement in Phase 1

Stakeholder	Role	Interest	Influence	Impact	Engagement Strategy
Delivery Person	Delivery support	High	Low	High	Keep informed – provide clear instructions for order handover, delivery status updates and completion
Lecturer / Instructor	Evaluator	Medium	High	Medium	Keep satisfied – ensure deliverables meet academic requirements

4.3 Stakeholder Classification – Power–Interest Grid

Based on the matrix above, stakeholders are classified as follows:

- High Power / High Interest (Manage Closely): Store Owner
- High Power / Low Interest (Keep Satisfied): Lecturer / Instructor
- Low Power / High Interest (Keep Informed): Customers, Delivery Person
- Low Power / Low Interest (Monitor): Sales Staff, Suppliers

4.4 Stakeholder Impact Analysis

The Store Owner is the most influential stakeholder in this project: the owner controls all final business decisions and provides the domain knowledge the platform must reflect. Customers, although lower in formal power, are the most affected stakeholders in day-to-day terms — the entire value of the platform depends on whether they find it easier to browse, order and review products than the current informal process.

Possible resistance is most likely from the Store Owner, Sales Staff and Delivery Person, who may be accustomed to informal ways of working and may be hesitant to adopt a structured digital workflow, particularly around order-status tracking, delivery handover and admin dashboard use. This resistance can be mitigated through simple onboarding and early, frequent demonstrations of the relevant workflows so the owner and operational staff see tangible time savings. Communication requirements differ by stakeholder: the Store Owner needs regular, non-technical progress updates and decision points; the Delivery Person needs clear instructions for accepting assigned orders, collecting packages and updating delivery status; and Customers need clear, simple in-app guidance once the platform goes live.

Epic 1 – Product & Catalogue Management

Responsible team member: IT24103841 – Razni Ahamed B S

5. Define the Process Scope

Item	Details
Process name	Product Catalogue Creation and Publishing
Triggering event	New stock arrives at the store, or the Store Owner decides to add/update a product listing
Start point	Admin logs into the admin dashboard to add or edit a product
End point(s)	Product is saved with an accurate availability status and published on the customer-facing storefront
Main business objective	Maintain an accurate, up-to-date and easily browsable product catalogue that supports customer discovery
Items within scope	Product creation, editing and deletion; Category and tag assignment; Product image upload and storage (Cloudflare R2); Stock-quantity entry and availability status; Customer browsing, search and filtering; Product detail page display
Items outside scope	Supplier procurement and purchasing; Physical inventory stock-taking / warehousing; Payment processing

6. Identify the Swim lanes

Swimlane	Main responsibilities in the process
Store Admin	Creates and maintains product listings, images, categories and stock levels
Customer	Browses, searches and filters the published catalogue and views product detail pages

7. Extract the Process Activities

No.	Activity	Responsible Swimlane
1	Admin logs into the admin dashboard	Store Admin
2	Admin selects 'Add New Product'	Store Admin
3	Admin enters product details (name, description, price)	Store Admin
4	Admin uploads product images	Store Admin
6	Admin assigns category and tags	Store Admin
7	Admin enters stock quantity	Store Admin
10	Admin corrects and resubmits invalid/duplicate entry	Store Admin
14	Customer browses, searches or filters products	Customer
15	Customer views the product detail page	Customer

8. Identify Decision Points

Decision question	Possible outcomes
Are all mandatory fields completed correctly?	Valid → proceed to save / Invalid → return to Admin for correction
Does the product already exist in the catalogue?	Duplicate → reject and notify Admin / Unique → proceed
Is stock quantity greater than zero?	In Stock → shown as purchasable / Out of Stock → shown as unavailable

9. Identify Handovers and Waiting Points

From	To	Information / document transferred	Possible issue
Store Admin	Store Owner / Admin	Product data, images and stock quantity	Incomplete or inconsistent data entry due to manual input
Store Owner / Admin	Customer	Published product listing and availability status	Delay between physical stock changes and system update causes incorrect availability display

10. As-Is UML Activity Diagram

11. Validate the Diagram

Validation question	Yes	Peer comments (No / notes)	Self-check comments
Is the start of the process clear?	Yes	Agreed – the start node and lane are unambiguous.	Diagram opens with a clear green 'Start' node in the Store Admin lane, where product creation begins.
Are all major actors represented as swim lanes?	Yes	Confirmed – matches the Section 6 actor list exactly.	All two actors from Section 6 (Store Owner / Admin, Customer) appear as labelled swim lanes.
Is every activity placed in the correct swim lane?	Yes	Agreed – no lane-placement issues found.	Each activity sits in the lane of the actor responsible for it .
Are activity labels clear and action-oriented?	Yes	Agreed – labels are concise and consistently verb-led.	Labels follow a verb-object structure.
Are decision outcomes shown using guard conditions?	Yes	Confirmed – both guards are labelled and easy to follow.	Both decision diamonds show guard conditions on their outgoing paths: [Invalid] and [Duplicate].
Are rejection paths represented?	Yes	Agreed – the rework loop is clearly dashed and correctly routed.	A dashed rework loop returns invalid/duplicate entries to 'Enter product details' for correction.
Are the end points clearly shown?	Yes	Confirmed – a single End node is sufficient for this flow.	A single red 'End' node closes the diagram after the customer views the product detail page.
Does the diagram represent the scenario accurately?	Yes	Agreed – diagram matches the documented process end-to-end.	The flow matches the scope, activities and decisions defined in Sections 5–9 for this epic.

12. Analyze the Current Process

No.	Problem identified	Evidence from the process	Business impact
1	Manual, unstructured product data entry	No existing system; details recorded informally	Increases errors and inconsistent listings, slowing catalogue growth
2	No automated duplicate checking today	Products currently tracked without a central record	Risk of duplicate/conflicting listings once digitized if not addressed
3	Stock status updated manually and infrequently	Stock counts kept informally, not synced with sales	Customers may see incorrect availability, damaging trust
4	No structured category/tag taxonomy	Products currently grouped informally by staff memory	Reduces discoverability and search/filter effectiveness
5	Product images not centrally stored or optimised	Images currently kept on personal devices	Slower page loads and inconsistent visual presentation

13. Identify Measurable Baseline Indicators

KPI	How it could be measured
Average time to publish a new product listing	Timestamp from product creation start to publish, averaged over a sample period
% of products with complete mandatory information	$(\text{Products with all required fields} \div \text{total products}) \times 100$
Catalogue update frequency	Number of product additions/edits per week
% of stock-status discrepancies	$(\text{Products with incorrect availability shown} \div \text{total products checked}) \times 100$
Average product search-to-view time	Time from search/filter action to product detail page view

14. Process Assessment

Currently, Gen-Z's product catalogue is maintained informally, with product details, categories and stock levels tracked manually rather than through a central system. This works adequately at low volumes but does not scale: as the number of clothing and perfume items grows, manual tracking increases the risk of inconsistent pricing, outdated stock information and duplicated listings. The main delays occur at the point of publishing new stock — since there is no digital record, updating customers on new arrivals depends entirely on the owner's availability and memory. The Store Owner and Customers are the most affected stakeholders: the owner bears the administrative burden of manually communicating stock changes, while customers experience unreliable availability information. Activities such as re-entering the same product information across different informal channels (e.g., telling different customers individually) create no direct business value and should be eliminated. Priority should be given to structuring catalogue data entry, introducing a single source of truth for stock status, and establishing a consistent category taxonomy. Before designing the To-Be process, the team should collect evidence on how frequently stock levels currently change, how many products are typically listed at once, and how customers currently discover new arrivals, to correctly size the catalogue and search features of the proposed platform.

Epic 2 – Customer & Order Management

Responsible team member: IT24101208 – Warnakula S P

5. Define the Process Scope

Item	Details
Process name	Customer Order Placement via WhatsApp Checkout
Triggering event	Customer adds one or more products to the shopping cart and proceeds to checkout
Start point	Customer adds a product to the shopping cart
End point(s)	Order is confirmed, processed and marked 'Ready for Delivery' for handover
Main business objective	Accurately capture customer order details, route them to the Store Owner via WhatsApp for confirmation, and prepare confirmed orders for delivery handover
Items within scope	Shopping cart management (add/update/remove items); Pre-filled WhatsApp order-message generation; Order record creation and status tracking; Admin order management dashboard; Customer order history and status view
Items outside scope	Online payment gateway processing; delivery person assignment, delivery execution and delivery-status tracking; review and content management; native mobile application checkout

6. Identify the Swim lanes

Swimlane	Main responsibilities in the process
Customer	Builds the cart, initiates WhatsApp checkout and confirms order details
Store Admin	Verifies stock, confirms the order, updates status, and manages dispatch through to completion

7. Extract the Process Activities

No.	Activity	Responsible Swimlane
1	Customer browses the product catalogue	Customer
2	Customer adds a product to the cart	Customer
3	Customer updates or removes cart items	Customer
4	Customer proceeds to checkout	Customer
7	Customer sends the WhatsApp message to the store	Customer
8	Admin receives the WhatsApp order message	Store Admin
9	Admin verifies stock availability for the order	Store Admin
10	Admin confirms the order and updates status to 'Confirmed'	Store Admin
11	Admin escalates high-value orders for approval	Store Admin
12	Admin processes the order and updates status to 'Processing'	Store Admin
13	Admin prepares the order for delivery handover and updates status to 'Ready for Delivery'	Store Admin

7.1 CRUD Operations Summary

Entity	Create	Read	Update	Delete
Customer	Customer registers an account (name, email, phone, address)	Customer views/edits own profile; Admin views customer details on an order	Customer updates profile info (address, phone)	Customer deletes account, or Admin deactivates it
Order	Customer places an order (cart → checkout creates record, status = Pending)	Customer views order history/status; Admin views incoming orders on the dashboard	Admin updates order status (Confirmed → Processing → Ready for Delivery)	Order cancelled (status change to 'Cancelled' rather than a hard delete, to preserve records)

8. Identify Decision Points

Decision question	Possible outcomes
Is the requested stock available?	Available → proceed to confirm / Not available → notify customer, cancel or offer alternative
Does the order value exceed the store's approval threshold (e.g., a high-value order)?	Above threshold → requires owner approval / Within threshold → standard processing
Does the customer confirm the order details on WhatsApp?	Confirmed → proceed to processing / Not confirmed → order cancelled

9. Identify Handovers and Waiting Points

From	To	Information / document transferred	Possible issue
Customer	Store Admin (via WhatsApp)	Order details (items, quantities, contact information)	Message details can be missed, delayed or misread since WhatsApp is not integrated with the order system
Store Admin	Store Owner / Admin	Confirmed order details and preparation status	Manual status updates may be delayed or entered inconsistently before the order reaches delivery management

10. As-Is UML Activity Diagram

11. Validate the Diagram

Validation question	Yes	Peer comments (No / notes)	Self-check comments
Is the start of the process clear?	Yes	Agreed – the Customer-lane start point is easy to locate.	Diagram opens with a clear green 'Start' node in the Customer lane, where cart building begins.
Are all major actors represented as swim lanes?	Yes	Confirmed – all three swimlanes match Section 6.	All two actors from Section 6 (Customer, Store Admin) appear as labelled swim lanes.
Is every activity placed in the correct swim lane?	Yes	Agreed – order-processing steps sit correctly under Store Admin.	Each activity sits in the correct lane (e.g. order message via WhatsApp under Store Admin, order confirmation under Store Admin).
Are activity labels clear and action-oriented?	Yes	Agreed – status labels (Pending/Confirmed / Processing / Ready for Delivery) are easy to follow.	Labels follow a verb-object structure (e.g. 'Confirm order', 'Mark order status as Completed').
Are decision outcomes shown using guard conditions?	Yes	Confirmed – both guard conditions are clearly labelled.	Both decision diamonds show guard conditions: [Not available] and [Above threshold].
Are rejection paths represented?	Yes	Agreed – both outcome nodes are clearly separated from the main flow.	Rejection/branch paths are shown leading to separate outcome nodes: 'Order cancelled / customer notified' and 'Escalated to Owner for approval'.
Are the end points clearly shown?	Yes	Confirmed – three terminal nodes are distinct and well labelled.	The main 'End' node plus the two labelled outcome nodes make all possible endings clear.
Does the diagram represent the scenario accurately?	Yes	Agreed – flow captures the WhatsApp ordering process well.	The flow matches the documented scope, activities and decisions defined for Epic 2 and clearly ends at the Ready for Delivery handover to Epic 3.

12. Analyze the Current Process

No.	Problem identified	Evidence from the process	Business impact
1	Manual order confirmation causes delay	Orders currently confirmed only when the owner is available to respond	Slower order turnaround and potential loss of interested customers
2	No upfront payment verification	Phase 1 deliberately excludes a payment gateway	Risk of cancelled or unfulfilled orders after confirmation
3	Order status tracked manually today	No digital order log currently exists	Inconsistent, error-prone status updates and no shared visibility
4	No automated stock deduction on order confirmation	Stock and orders are not currently linked	Risk of overselling out-of-stock items
5	No centralized handover to delivery	All updates currently rely on manual WhatsApp replies	Orders are not systematically marked as ready for delivery or transferred through a structured delivery workflow.

13. Identify Measurable Baseline Indicators

KPI	How it could be measured
Average order confirmation time	Time from order placement (Pending) to Admin confirmation
Order cancellation rate	$(\text{Cancelled orders} \div \text{total orders placed}) \times 100$
% of orders with accurate stock at confirmation	$(\text{Orders confirmed without stock conflict} \div \text{total orders}) \times 100$
Average order preparation cycle time	Time from 'Confirmed' to 'Ready for Delivery'
Order status update lag	Average time between an actual status change and its reflection in the system

14. Process Assessment

Gen-Z's current order process is entirely manual: customers place orders informally by phone or WhatsApp message, and the owner personally verifies stock, confirms details and tracks fulfilment from memory or handwritten notes. The largest delays occur between order placement and confirmation, since this step depends entirely on the owner's availability, and again between confirmation and dispatch, where there is no structured tracking of what stage each order is at. Customers are the most affected stakeholders, as they receive little to no visibility into their order status once it is placed, and the Store Owner is disproportionately burdened by having to personally manage every order end-to-end. Repeatedly re-explaining order details across multiple WhatsApp messages creates no direct business value and should be reduced. Priority should be given to structuring order capture and giving both the customer and admin a single, shared view of order status up to the point where the order is prepared and marked Ready for Delivery. Delivery execution and customer-visible delivery tracking are handled separately under Epic 3.

Epic 3 – Delivery Tracking with Review Management

Responsible team member: IT24101437 – Sashorinth N

5. Define the Process Scope

Item	Details
Process name	Order Delivery, Tracking, Review & Content Management
Triggering event	An order is marked 'Ready for Delivery', or a customer wishes to submit a review, or the Store Admin needs to update static storefront content.
Start point	Store Admin receives an order marked 'Ready for Delivery' and prepares it for delivery handover.
End point(s)	Order is delivered and marked 'Delivered'; an approved review is published; or updated static content is published.
Main business objective	Ensure packed orders are handed to a delivery person, provide customers with reliable order-status visibility throughout delivery, and manage customer reviews and public-facing content
Items within scope	Order packing and delivery-person assignment; delivery handover; delivery status updates (Assigned, Picked Up, Out for Delivery, Delivered); customer-visible order-status tracking; delivery completion; star rating and written review submission; review validation and moderation; display of approved reviews and aggregate ratings; moderation activity logging; static page content management (About, Contact).
Items outside scope	Product catalogue management (covered in Epic 1); customer order placement and order confirmation (covered in Epic 2); online payment gateway processing; refunds or purchase dispute resolution.

6. Identify the Swim lanes

Swimlane	Main responsibilities in the process
Store Admin	Packs orders, assigns delivery persons, hands over packages, monitors delivery progress, moderates reviews and manages static page content
Delivery Person	Accepts assigned orders, collects packed packages, updates delivery status and delivers orders to customers
Customer	Views order status, receives the order, submits ratings/reviews for purchased products and views approved content

7. Extract the Process Activities

No.	Activity	Responsible Swimlane
2	Admin reviews the order and packs the items	Store Admin
3	Admin assigns the order to a delivery person	Store Admin
5	Delivery Person accepts the assigned order	Delivery Person
6	Delivery Person collects the packed order	Delivery Person
8	Delivery Person starts delivery	Delivery Person
10	Customer views current order status	Customer
11	Delivery Person delivers the order	Delivery Person
12	Customer receives the order	Customer
14	Customer opens the purchased product page	Customer
15	Customer submits a star rating and written review	Customer
18	Admin opens the moderation panel	Store Admin
19	Admin reviews submitted content	Store Admin
20	Admin approves or rejects the review	Store Admin
23	Admin deletes inappropriate review if required	Store Admin
25	Admin updates About/Contact content	Store Admin

8. Identify Decision Points

Decision question	Possible outcomes
Is a delivery person available and assigned?	Available → assign and continue / Not available → hold order and notify Admin
Has the delivery person collected the order?	Collected → Picked Up / Not collected → remain Assigned
Has the order been delivered successfully?	Delivered → Delivered / Not delivered → remain Out for Delivery or return to Admin for follow-up
Is the review linked to a verified purchase and not a duplicate?	Valid → moderation queue / Invalid → rejected
Does the review meet moderation guidelines?	Approved → published / Rejected → not published

9. Identify Handovers and Waiting Points

From	To	Information / document transferred	Possible issue
Store Admin	Delivery Person	Packed order, customer delivery details and assigned order information	Manual handover may cause incorrect packages, addresses or delivery assignments
Delivery Person	Store Owner / Admin	Pickup, out-for-delivery and delivery-completion status	Status updates may be delayed if entered manually
Store Owner / Admin	Customer	Current order/delivery status	Customers may remain uncertain if status updates are delayed
Customer	Store Owner / Admin	Review text and star rating	Invalid or duplicate submissions may occur without validation
Store Admin	Store Admin	Pending review queue	Without structured moderation, reviews may be handled inconsistently

10. As-Is UML Activity Diagram

11. Validate the Diagram

Validation question	Yes	Peer comments (No / notes)	Self-check comments
Is the start of the process clear?	Yes	Agreed – the Store Admin-lane start point is clear and easy to locate.	Diagram opens with a clear green 'Start' node when the order is marked 'Ready for Delivery', beginning the delivery process.
Are all major actors represented as swim lanes?	Yes	Confirmed – all three swim lanes match Section 6.	All three actors from Section 6 (Store Admin, Delivery Person, Customer) appear as labelled swim lanes.
Is every activity placed in the correct swim lane?	Yes	Agreed – delivery, tracking and review activities are placed under the appropriate actors.	Each activity is assigned to the responsible lane, e.g. packing and assignment under Store Admin, delivery activities under Delivery Person, and order viewing/review submission under Customer.
Are activity labels clear and action-oriented?	Yes	Agreed – activity labels are concise and easy to follow.	Labels follow a clear verb–object structure such as 'Pack order', 'Assign delivery person', 'Update status to Picked Up', 'Deliver order' and 'Submit star rating & written review'.
Are decision outcomes shown using guard conditions?	Yes	Confirmed – the delivery and review decision outcomes are clearly labelled.	Decision branches use guard conditions such as [Available] / [Not available], [Delivered] / [Not delivered], and [Valid] / [Invalid / duplicate].
Are rejection / exception paths represented?	Yes	Agreed – exception paths are clearly separated from the main delivery and review flows.	Exception paths are represented for unavailable delivery assignment, unsuccessful delivery, invalid/duplicate reviews and rejected reviews.
Are the end points clearly shown?	Yes	Confirmed – the delivery, review and content-management completion points are identifiable.	The diagram clearly shows the completion of delivery as 'Delivered', approved review publication, and updated static content publication.
Does the diagram represent the scenario accurately?	Yes	Agreed – the combined delivery, tracking, review and content-management workflow is accurately represented.	The flow matches the documented scope, activities, decisions and handovers defined in Sections 5–9 for Epic 3.

12. Analyze the Current Process

No.	Problem identified	Evidence from the process	Business impact
1	No structured delivery assignment and handover process	Orders are not systematically assigned to a delivery person after preparation	Delivery delays and higher operational effort
2	No customer-visible delivery tracking	Customers have no centralized way to see whether an order has been picked up, is out for delivery or delivered	Customer uncertainty and repeated enquiries
3	Delivery status updates are manual and inconsistent	Pickup and delivery events are not centrally recorded	Poor tracking accuracy and limited accountability
4	No verified-purchase review and moderation workflow	Customer feedback is currently collected informally	Risk of unreliable or inappropriate reviews
5	No centralized content and rating management	Feedback and public-facing content are managed informally	Reduced customer trust and inconsistent store information

13. Identify Measurable Baseline Indicators

KPI	How it could be measured
Average delivery assignment time	Time from Ready for Delivery to delivery-person assignment
Average delivery cycle time	Time from Picked Up to Delivered
Delivery status update lag	Time between actual delivery event and system status update
Review submission rate	$(\text{Reviews submitted} \div \text{completed orders}) \times 100$
Average moderation turnaround time	Time from review submission to Admin decision

14. Process Assessment

Gen-Z currently has no structured mechanism for delivery tracking, customer review management or public-facing content management. Delivery arrangements are handled informally, so there is no

centralized record showing which delivery person has accepted an order, whether it has been picked up, whether it is out for delivery, or whether it has been delivered. Customers therefore have limited visibility into delivery progress and may need to contact the store for updates. Similarly, customer feedback is shared informally and is not captured, aggregated or displayed systematically. The Store Owner is the most affected internal stakeholder because delivery coordination and feedback management add to the existing administrative workload, while Customers are most affected by the lack of delivery visibility and structured trust signals. Priority should be given to establishing a clear delivery handover, customer-visible order-status tracking, verified-purchase reviews, moderation and centralized content management.

Epic 4 – Store Administration Management

Responsible team member: IT24101437 – Sashorinth N

5. Define the Process Scope

Item	Details
Process name	Admin User, Access and Store Settings Management
Triggering event	Store Owner needs to add/manage staff accounts, review overall store activity, or update store-wide settings
Start point	Owner/Admin logs into the admin dashboard's settings or user-management section
End point(s)	The user account, role, permission, or store-setting change is saved and takes effect across the platform
Main business objective	Provide the Store Owner with centralized administrative control, role-based access management, and system-wide operational visibility
Items within scope	Staff/admin user account creation and management; Role-based access control assignment; Unified admin dashboard summarising products, orders, delivery status and reviews; Store-wide settings configuration (contact info, WhatsApp number); Operational summaries and activity logging
Items outside scope	Detailed product catalogue editing (covered in Epic 1); Individual order processing (covered in Epic 2); Review content moderation (covered in Epic 3)

6. Identify the Swim lanes

Swimlane	Main responsibilities in the process
Store Owner (Super Admin)	Creates/manages staff accounts, assigns roles, configures settings and reviews dashboard summaries
Staff / Admin User	Logs in with assigned credentials and operates within permitted modules

7. Extract the Process Activities

No.	Activity	Responsible Swimlane
1	Owner logs into the admin dashboard	Store Owner
2	Owner navigates to the user-management section	Store Owner
3	Owner creates a new staff account	Store Owner
5	Owner assigns a role and access permissions	Store Owner
7	Staff logs in with assigned credentials	Staff / Admin User
9	Owner reviews the dashboard summary (products, orders, delivery status, reviews)	Store Owner
10	Owner monitors product listings, order statuses and delivery progress	Store Owner
11	Owner configures store-wide settings (WhatsApp number, contact info)	Store Owner
13	Owner deactivates a staff account if no longer required	Store Owner
15	Owner generates an operational summary report	Store Owner

8. Identify Decision Points

Decision question	Possible outcomes
Are the new account details valid and complete?	Valid → account created / Invalid → returned to Owner for correction
Should the staff account remain active?	Keep active → normal access continues / Deactivate → access revoked immediately

9. Identify Handovers and Waiting Points

From	To	Information / document transferred	Possible issue
Store Owner	Store Owner	Role and permission assignments for staff accounts	Manual assignment risks incorrect or overly broad permissions being granted
Store Owner	Staff / Admin User	Login credentials and access rights	Delay between account creation and staff being able to log in, due to manual coordination

10. As-Is UML Activity Diagram

11. Validate the Diagram

Validation question	Yes	Peer comments (No / notes)	Self-check comments
Is the start of the process clear?	Yes	Agreed – the Store Owner-lane start point is unambiguous.	Diagram opens with a clear green 'Start' node in the Store Owner lane, where account creation begins.
Are all major actors represented as swim lanes?	Yes	Confirmed – the three swimlanes match Section 6 exactly.	All two actors from Section 6 (Store Owner, Staff/Admin User) appear as labelled swim lanes.
Is every activity placed in the correct swim lane?	Yes	Agreed – no misplaced activities found.	Each activity sits in the correct lane (e.g. login under Staff/Admin User, account management under Store Owner).
Are activity labels clear and action-oriented?	Yes	Agreed – action-oriented labels are consistent with the other epics.	Labels follow a verb-object structure (e.g. 'Assign role & access permissions', 'Configure store-wide settings').
Are decision outcomes shown using guard conditions?	Yes	Confirmed – the [Invalid] guard is clearly labelled.	The decision diamond shows a guard condition on its outgoing path: [Invalid].
Are rejection paths represented?	Yes	Agreed – the dashed rework loop is easy to follow.	A dashed rework loop returns invalid account details to 'Create new staff account' for correction.
Are the end points clearly shown?	Yes	Confirmed – a single End node is appropriate here.	A single red 'End' node closes the diagram after settings are saved and logged.
Does the diagram represent the scenario accurately?	Yes	Agreed – diagram matches the administration workflow described.	The flow matches the scope, activities and decisions defined in Sections 5–9 for this epic.

12. Analyze the Current Process

No.	Problem identified	Evidence from the process	Business impact
1	No formal onboarding/offboarding process for staff access	Staff currently given informal, verbal permission to assist with sales	Risk of unauthorized or lingering access when staff roles change
2	Permissions assigned manually and inconsistently	No access-control system currently exists	Risk of staff having more (or less) access than their role requires
3	No centralized activity log	Administrative actions are not currently recorded	Difficult to audit changes or investigate issues after the fact
4	No unified operational dashboard	Owner currently checks products, orders and stock separately/manually	Time-consuming oversight and higher chance of missed issues
5	Store settings (contact info, WhatsApp number) updated informally	Currently shared verbally or via individual messages	Customers may reach outdated contact channels

13. Identify Measurable Baseline Indicators

KPI	How it could be measured
Average account setup time	Time from account-creation request to staff being able to log in
% of accounts with correctly assigned roles	$(\text{Accounts with appropriate role/permissions} \div \text{total accounts}) \times 100$
Number of unauthorized access incidents	Count of access events outside a user's assigned role, per period
Settings-change audit completeness	% of store-setting changes that are logged with who/when
Time to generate an operational summary	Time taken for the Owner to obtain a current view of products, orders, delivery status and reviews

14. Process Assessment

Administrative oversight at Gen-Z today is entirely dependent on the Store Owner personally tracking products, orders, stock and any staff activity without any centralized system or access controls. There are no formal delays in the traditional sense, but the lack of a unified dashboard means the owner spends significant time manually cross-checking different aspects of the business, which is itself the key inefficiency. The Store Owner is by far the most affected stakeholder, carrying the full administrative burden alone, while Sales Staff are affected by having informally granted, unstructured access to store operations. Activities such as the owner manually re-checking product, order, delivery and review information from separate informal sources create no direct business value and should be consolidated into a single dashboard view. This process area should be prioritized early, since a well-designed admin and access-control foundation underpins the reliability of the other three epics. Before designing the To-Be process, the team should gather evidence on how many staff currently need system access, what level of access each role should have, and what information the owner most needs visibility into on a daily basis.

Appendix A – Meeting Notes

Date	Attendees	Discussion Points	Decisions / Action Items
29/07/2026	Warnakula S P, Sashorinth N, Razni Ahamed B S	Kickoff meeting for Sprint 0. Agreed on the scope of the business architecture assessment and confirmed GenZ as the client. Assigned each member a lead role across the organization profile, stakeholder analysis, and the four core epics.	Warnakula S P to lead stakeholder identification and the Power–Interest grid; Sashorinth N and Razni Ahamed B S to begin drafting the As-Is process scope for Epics 1–2 and 3–4 respectively. Next review set for 31/07/2026.
31/07/2026	Warnakula S P, Sashorinth N, Razni Ahamed B S	Reviewed the draft stakeholder matrix and discussed classification of the Store Owner, Lecturer/Instructor, Customers, Sales Staff, Suppliers and Delivery Person into the Power–Interest quadrants. Cross-checked swimlane definitions for each epic to keep actor names consistent across all four process areas.	Agreed to standardise swimlane labels across all four process areas based on the actual human actors involved in the As-Is operations. Razni Ahamed B S to update the handover and waiting-point tables to match.
03/08/2026	Warnakula S P, Sashorinth N, Razni Ahamed B S	Walked through the As-Is UML activity diagrams for all four epics as a group, checking that each decision point, rework loop and end state matched the activity tables. Discussed the problems identified and baseline KPI sections for each process area.	Diagrams validated and peer-reviewed by all three members. Sashorinth N to finalise the baseline KPI tables; Warnakula S P to consolidate the problems-identified tables into the executive summary.
18/08/2026	Warnakula S P, Sashorinth N, Razni Ahamed B S	Final review of the complete draft report against the module's formatting guidelines. Checked cover page details, table and figure numbering, and overall page count before supervisor sign-off.	Report approved for submission pending supervisor feedback. Submission date confirmed as 18/08/2026.
24/08/2026	Warnakula S P, Sashorinth N, Razni Ahamed B S	Epic structure revised following report review.	Epic 3 was expanded by merging Delivery Tracking with Review Management. Epic 2 now ends at 'Ready for Delivery', while delivery assignment, tracking and completion are handled under Epic 3.
